Resumen de Internación

PACIENTE DE TRES MESES DE EDAD, SIN ANTECEDENTES PATOLOGICOS DE RELEVANCIA, INGRESA EL DIA 20/7 A SALA DE INTERNACION PEDIATRICA POR BRONQUIOLITIS. LA NIÑA COMENZO 15 DIAS PREVIIOS CON CVAS Y LUEGO SILBILANCIAS, CONSULTANDO EN VARIAS OPORTUNIDADES A GUARDIA DE ESTA INSTITUCION. CONSULTA EL 20/7 POR REGULAR MECANICA VENTILATORIA, SE DECIDE SU INTERNACION PARA OBSERVACION Y EVENTUAL OXIGENOTERAPIA. PERMANECIO EN BEG, CON MEJORIA DE TAQUIPNEA Y DE MECANICA VENTILATORIA, SIN REQUERIMIENTO DE OXIGENO, CON SALBUTAMOL C/ 4 HS Y METILPREDNISONA 1MG/KG/DIA C/ 8 HS (RECIBIO 3 DIAS DE TTO CORTICOIDE EN TOTAL) . SE REALIZA VSNF: PENSIENTE RESULTADO. POR BUENA EVOLUCION CLINICA, SIN REQUERIMIENTO DE OXIGENO, SE DECIDE OTORGAR EL EGRESO SANATORIAL.

Bronquiolitis

- Definición:
  - Primer (o segundo) episodio de sibilancias asociado a manifestaciones clínicas de infección viral en un niño menor de dos años. Es una inflamación difusa y aguda de las vías aéreas inferiores, de naturaleza infecciosa (IRAB), expresada clínicamente por obstrucción de la vía aérea pequeña.

Respiratory Syncytial Virus and Recurrent Wheeze in Healthy Preterm Infants

Maarten O. Blanken, M.D., Maroeska M. Rovers, Ph.D., Jorine M. Molenaar, M.D., Pauline L. Winkler-Seinstra, M.Sc., Adam Meijer, Ph.D., Jan L.L. Kimpen, M.D., Ph.D., and Louis Bont, M.D., Ph.D., for the Dutch RSV Neonatal Network

Niños entre 33 y <36 semanas de edad gestacional

Table 3. Infants with Wheezing.*

Variable	Palivizumab (N=214)	Placebo (N=215)	Absolute Reduction†	Relative Risk Reduction (95% CI)†
Any wheezing — no. of infants (%)	66 (30.8)	101 (47.0)	16.2	34 (14–53)
Wheezing episodes — no.	137	266	129	48 (32–62)
Recurrent wheezing — no. of infants (%)	24 (11.2)	45 (20.9)	9.7	47 (14–80)

* Any wheezing was defined as at least one episode of wheezing during the first year of life. A wheezing episode was defined as a respiratory episode with wheezing on more than 1 day. Recurrent wheezing was defined as three or more episodes of wheezing during the first year of life. P<0.001 for the between-group comparisons for any wheezing and wheezing episodes and P=0.005 for recurrent wheezing.

† The values for absolute reduction are percentage points, and the values for relative risk reduction are numbers of episodes.

El tratamiento con palivizumab redujo significativamente las sibilancias recurrentes en niños sanos durante el primer año de vida. Esto demuestra la importancia del VSR como mecanismo de producción de sibilancias en ésta edad

Figure 2. Cumulative Wheezing Days for 429 Preterm Infants during the First Year of Life.

P<0.001 for the comparison between palivizumab and placebo with the use of Poisson regression.

CONCLUSIONS

In otherwise healthy preterm infants, palivizumab treatment resulted in a significant reduction in wheezing days during the first year of life, even after the end of treatment. These findings implicate RSV infection as an important mechanism of recurrent wheeze during the first year of life in such infants. (Funded by Abbott

Opciones terapéuticas actuales para VSR

- Terapia de soporte (oxígeno suplementario, hidratación, permeabilizar narinas, alimentación)
- No ha vacunas disponibles (se encuentran en desarrollo)
- Inmunización pasiva profiláctica con palivizumab (Pre-términos< 36 semanas de edad gestacional)

- Tratamiento con Rivavirin en aerosol

- Los corticoides, broncodilatadores, montelukast, adrenalina y ClNa 3% no han demostrado ser útiles en el tratamiento de la enfermedad

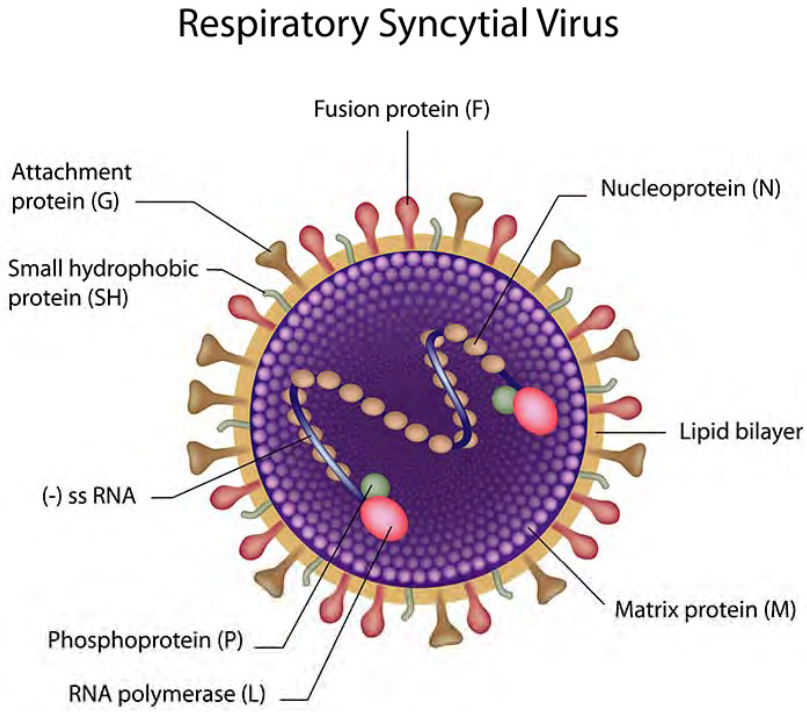
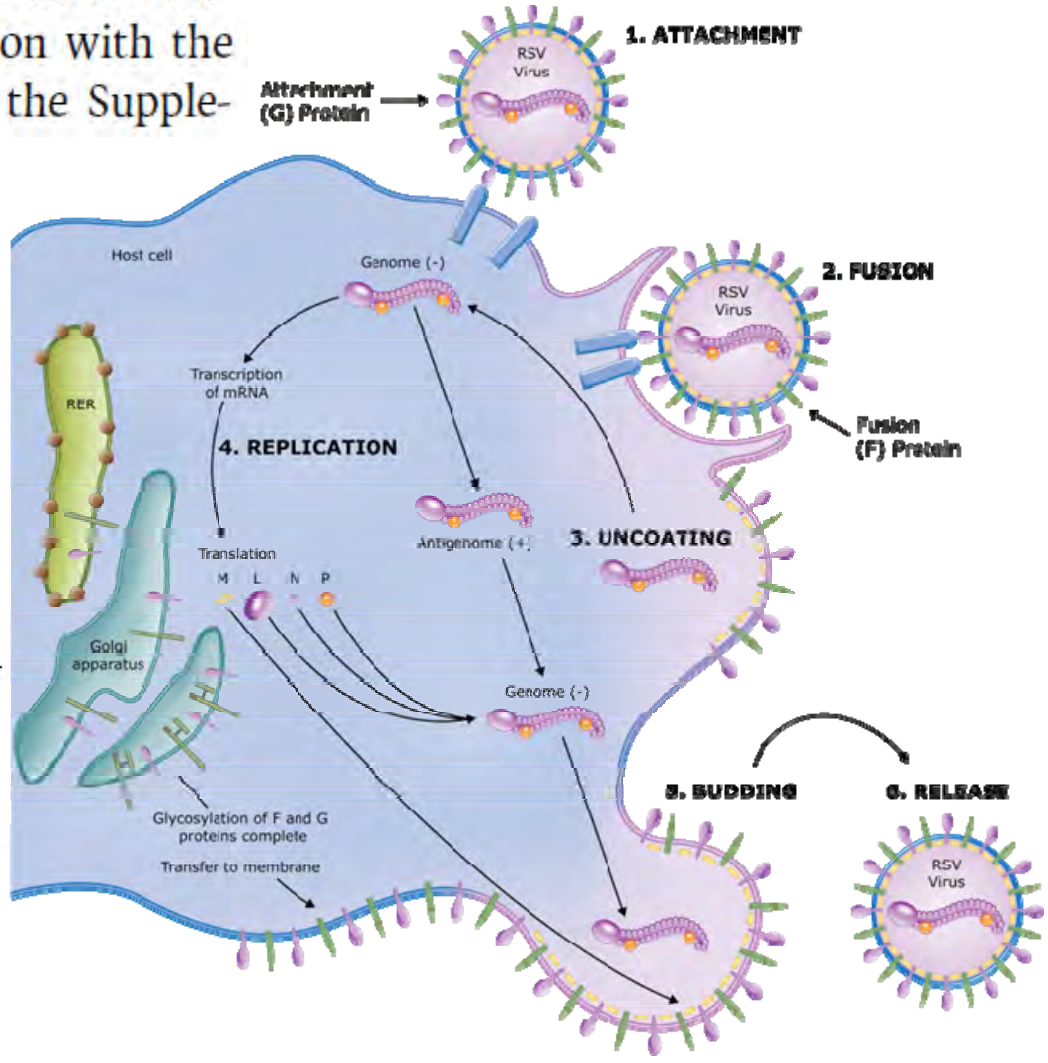
Oral GS-5806 Activity in a Respiratory Syncytial Virus Challenge Study

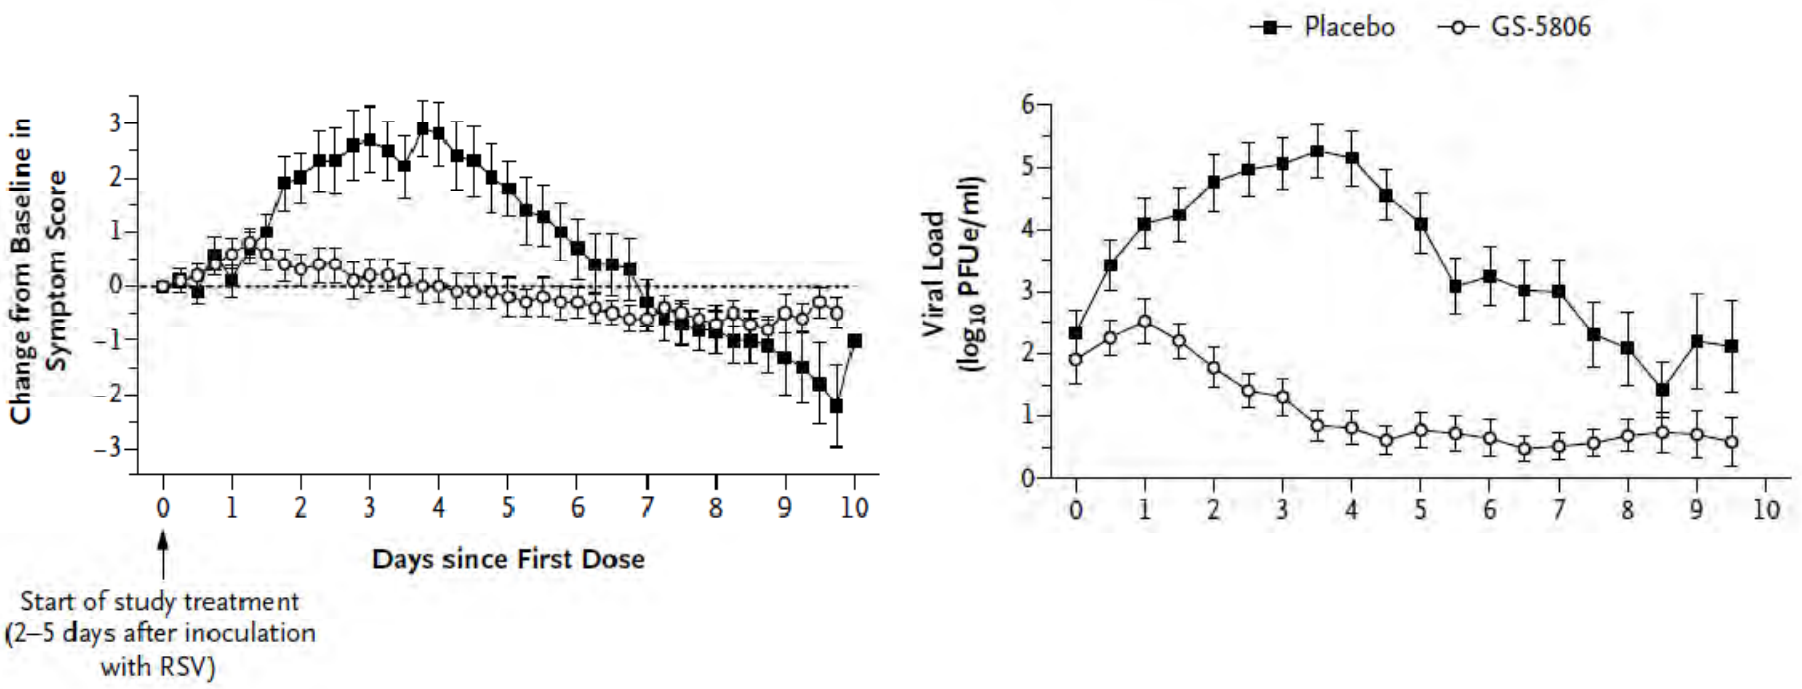
John P. DeVincenzo, M.D., Richard J. Whitley, M.D., Richard L. Mackman, Ph.D., Cecilia Scaglioni-Weinlich, M.D., Lisa Harrison, M.L.T., Eric Farrell, B.S., Stephen McBride, B.S., Robert Lambkin-Williams, Ph.D., Robert Jordan, Ph.D., Yan Xin, Ph.D., Srini Ramanathan, Ph.D., Thomas O'Riordan, M.D., Sandra A. Lewis, M.S., Xiaoming Li, Ph.D., Seth L. Toback, M.D., Shao-Lee Lin, M.D., Ph.D., and Jason W. Chien, M.D.

GS-5806 is a novel oral small molecule that inhibits RSV entry at low nanomolar concentrations by blocking viral-envelope fusion with the host-cell membrane (for details see the Supple-





Administración de la droga vía oral, al comenzar los síntomas o 5 días después de la inoculación intranasal de VRS en adultos.



CONCLUSIONS

Treatment with GS-5806 reduced the viral load and the severity of clinical disease in a challenge study of healthy adults. (Funded by Gilead Sciences; ClinicalTrials.gov number, NCT01756482.)

En la actualidad, suele utilizarse el término «neumonía atípica» para designar aquella patología respiratoria infecciosa que presenta disociación entre el cuadro clínico y lo que se esperaría observar en la radiografía, es decir, que no presenta una consolidación lobar, segmentaria o subsegmentaria

… Si bien éste término se utiliza en lo cotidiano, su alcance debería reservarse para aquellas entidades de comportamiento clínico o epidemiológico verdaderamente atípico. Los microorganismos habituales (virus, *Mycoplasma pneumoniae,* clamidias) suelen presentar cuadros clínicos bastante característicos, por lo que la denominación de «atípico» es imprecisa.

Comparing treatment of non-severe pneumonia in children aged 2 to 59 months with and without antibiotics

Authors' conclusions:

There is a clear need for RCTs to address this question in representative populations. We do not currently have evidence to support or challenge the continued use of antibiotics for the treatment of non-severe pneumonia, as suggested by WHO guidelines.

No encontramos evidencias en la actualidad que avalen la utilización de antibióticos para el tratamiento de neumonías «no severas» como sugiere la OMS

Antibiotics for community-acquired lower respiratory tract infections secondary to *Mycoplasma pneumoniae* in children (Review)

Gardiner SJ, Gavranich JB, Chang AB

THE COCHRANE COLLABORATION®

The Cochrane Library. **Published:** 8 January 2015

Quality of evidence

Overall the quality of the evidence for each of the main outcomes is very low as there are insufficient data for any outcome. Hence, currently, there is insufficient evidence to show conclusively that antibiotics are effective in children with LRTI caused by *M. pneumoniae*.

Sigue existiendo una necesidad de estudios de alta calidad, doble ciegos, randomizados y controlados para demostrar la eficacia y seguridad de los antibióticos para IRAB por *M. pneumoniae* en niños

There is insufficient evidence to draw any specific conclusions about the efficacy of antibiotics for this condition in children (although one trial suggests macrolides may be efficacious in some children with LRTI secondary to *Mycoplasma*). The use of antibiotics has to be balanced with possible adverse events. There is still a need for high quality, double-blinded RCTs to assess the efficacy and safety of antibiotics for LRTI secondary to *M. pneumoniae* in children.

THE ROLE OF RESPIRATORY VIRAL INFECTIONS AMONG CHILDREN HOSPITALIZED FOR COMMUNITY-ACQUIRED PNEUMONIA IN A DEVELOPING COUNTRY

*Cristiana M. Nascimento-Carvalho, MD, PhD,**

Abstract: We report an investigation for 16 bacteria and viruses among 184 children hospitalized with pneumonia in Salvador, Brazil. Etiology was established in 144 (78%) cases. Viral, bacterial, and mixed infections were found in 110 (60%), 77 (42%), and 52 (28%) patients, respectively. Rhinovirus (21%) and *Streptococcus pneumoniae* (21%) were the most common pathogens. Our results demonstrate the importance of viral and pneumococcal infections among those patients.

M. pneumoniae infections were significantly more common in children ≥2 years of age (15%) than in those <2 years of age (3%) ($P = 0.005$).

Clinical efficacy of macrolide antibiotics against genetically determined macrolide-resistant *Mycoplasma pneumoniae* pneumonia in paediatric patients

YASUHIRO KAWAI,[1] NAOYUKI MIYASHITA,[2] TETSUYA YAMAGUCHI,[1] AKI SAITOH,[1] EISUKE KONDOH,[1] HIROKI FUJIMOTO,[1] HIDETO TERANISHI,[1] MIKA INOUE,[1] TOKIO WAKABAYASHI,[1] HIROTO AKAIKE,[1] SATOKO OGITA,[1] KOZO KAWASAKI,[1] KIHEI TERADA,[1] FUMIO KISHI[3] AND KAZUNOBU OUCHI[1]

Departments of [1]Pediatrics, [2]Internal Medicine 1 and [3]Molecular Genetics, Kawasaki Medical School, Okayama, Japan

SUMMARY AT A GLANCE

There have been no studies evaluating the microbiological efficacy of macrolides in patients with macrolide-resistant (MR) *Mycoplasma pneumoniae* infections. This study showed that the microbiological and clinical efficacies of macrolides for treating patients with MR *M. pneumoniae* pneumonia were low.

Este estudio demuestra que la eficacia clínica y microbiológica de los macrólidos para tratar pacientes con *M. pneumoniae* resistente a los macrólidos es baja

Respirology (2012) **17**, 354–362

Macrolide-Resistant *Mycoplasma pneumoniae*, United States[1]

Emerging Infectious Diseases • www.cdc.gov/eid • Vol. 21, No. 8, August 2015

Using genotypic and phenotypic methods, we detected high-level MRMP in 13.2% of 91 *M. pneumoniae*–positive specimens from 6 US locations.

Clinical outcomes and macrolide resistance in *Mycoplasma pneumoniae* infection in Scotland, UK

Journal of Medical Microbiology (2013), **62**, 1876–1882

Macrolide resistance conferred by the 23S rRNA gene mutation was found in samples from 6 out of 32 patients (19 %) in the subset tested. The results suggest that the recent *M. pneumoniae* epidemic was associated with a significant burden of hospital admission locally. The study also describes the first case series of macrolide-resistant *M. pneumoniae* in the UK, indicating that macrolide resistance surveillance is warranted in preparation for the next epidemic.

Macrolide Resistance in *Mycoplasma pneumoniae*, Israel, 2010

Diana Averbuch,[1] Carlos Hidalgo-Grass,[1]
Allon E. Moses, Dan Engelhard, and Ran Nir-Paz

Conclusions

The observed rate of resistance in our hospital-based patients in the current surge of *M. pneumoniae*–associated cases is 30%.

Molecular Mechanisms of Macrolide Resistance in Clinical Isolates of *Mycoplasma pneumoniae* from China[▽]

Deli Xin,[1]* Zuhuang Mi,[2] Xu Han,[3] Ling Qin,[2] Jing Li,[1] Tianli Wei,[1] Xiaogeng Chen,[1] Shaojie Ma,[1] Ancun Hou,[1] Gui Li,[1] and Dawei Shi[1]

Fifty clinical *Mycoplasma pneumoniae* strains were isolated from 370 children with respiratory tract infections. Four strains were susceptible to macrolides, while the other 46 (92%) were macrolide resistant. The molecular mechanism of resistance was shown to be associated with point mutations in 23S rRNA at positions 2063 and 2064.

Cincuenta cepas *Mycoplasma pneumoniae* fueron aisladas de 370 niños con infecciones de las vías respiratorias. Cuatro cepas fueron sensibles a macrólidos, mientras que las otras 46 (92%) fueron resistentes a macrólidos. Los mecanismos moleculares de la resistencia han demostrado estar asociados con mutaciones puntuales en rRNA 23S en las posiciones 2063 y 2064.

La PCR ha aumentado la detección viral en sujetos asintomáticos

- Revisión de la literatura desde 1965 hasta el presente.
- 51 artículos; n ~ 15.000 muestras
- Prevalencia de virus respiratorios en muestras de secreciones de individuos asintomáticos

Virus	PCR +	Convencional +	p
HRV	15% (365/2416)	1.5% (255/14669)	0.0001
RSV	2,6% (51/1974)	0.7% (23/3175)	0.0001
AdV	5.3% (103/1958)	1.8% (40/2175)	0.0001

THE ROLE OF RESPIRATORY VIRAL INFECTIONS AMONG CHILDREN HOSPITALIZED FOR COMMUNITY-ACQUIRED PNEUMONIA IN A DEVELOPING COUNTRY

*Cristiana M. Nascimento-Carvalho, MD, PhD,**

Abstract: We report an investigation for 16 bacteria and viruses among 184 children hospitalized with pneumonia in Salvador, Brazil. Etiology was established in 144 (78%) cases. Viral, bacterial, and mixed infections were found in 110 (60%), 77 (42%), and 52 (28%) patients, respectively. Rhinovirus (21%) and *Streptococcus pneumoniae* (21%) were the most common pathogens. Our results demonstrate the importance of viral and pneumococcal infections among those patients.
